POSITION STATEMENT

Open Access

## Standardized image interpretation and post-processing in cardiovascular magnetic resonance - 2020 update

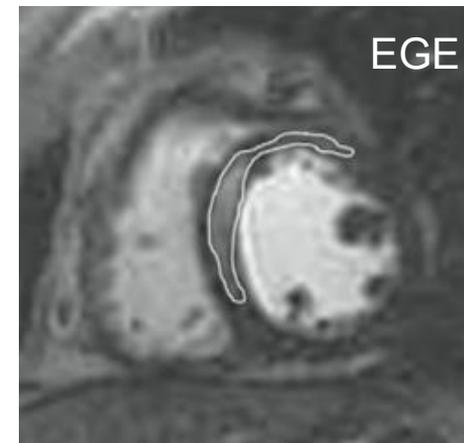

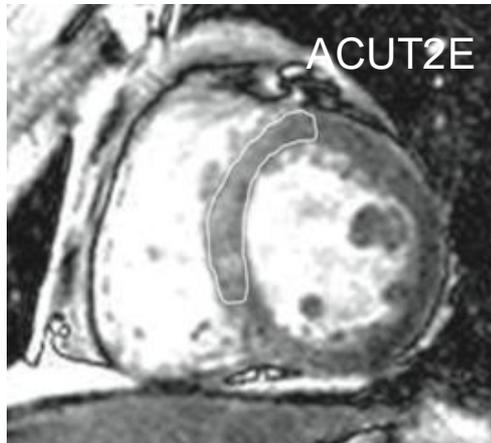

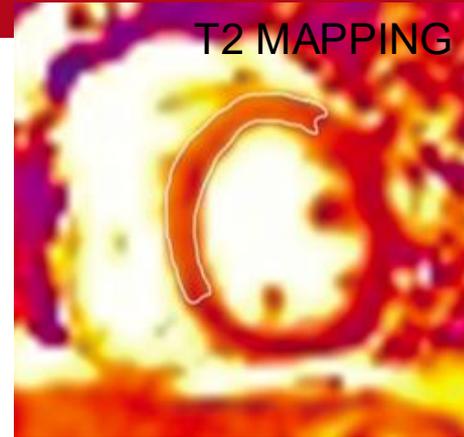

### Society for Cardiovascular Magnetic Resonance (SCMR): Board of Trustees Task Force on Standardized Post-Processing

Jeanette Schulz-Menger<sup>1\*</sup>, David A. Bluemke<sup>2</sup>, Jens Bremerich<sup>3</sup>, Scott D. Flamm<sup>4</sup>, Mark A. Fogel<sup>5</sup>, Matthias G. Friedrich<sup>6</sup>, Raymond J. Kim<sup>7</sup>, Florian von Knobelsdorff-Brenkenhoff<sup>8</sup> , Christopher M. Kramer<sup>9</sup>, Dudley J. Pennell<sup>10</sup>, Sven Plein<sup>11</sup> and Eike Nagel<sup>12</sup>

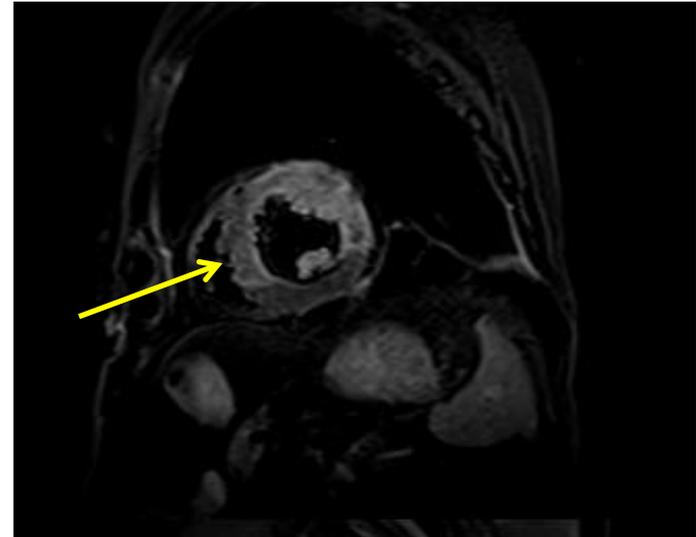

# Imaging Oedema

- Before contrast administration
- To assess presence of myocardial and pericardial edema
- Dark blood T2w TSE
- Slice  $\geq 10$  mm for the best SNR

EDEMA = HYPER-INTENSE

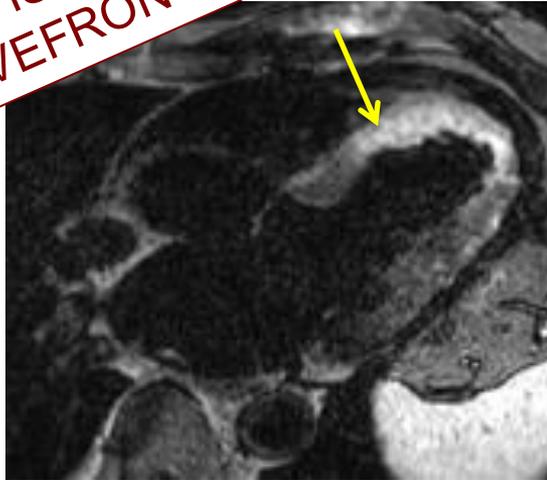

# T2-weighted Images

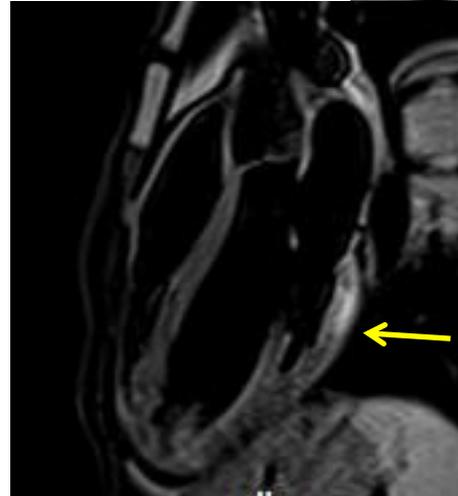

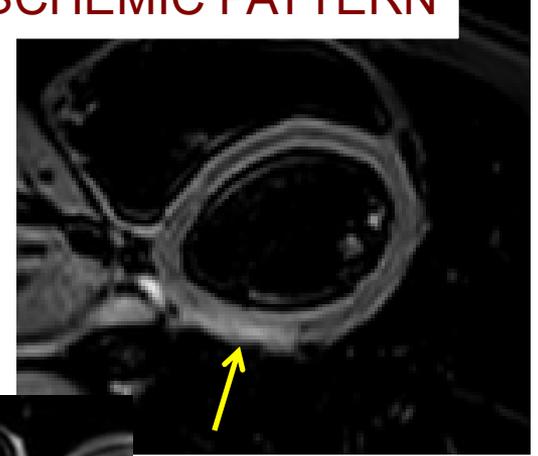

## ISCHEMIC PATTERN

Follows ISCHEMIC  
WAVEFRONT

## NON ISCHEMIC PATTERN

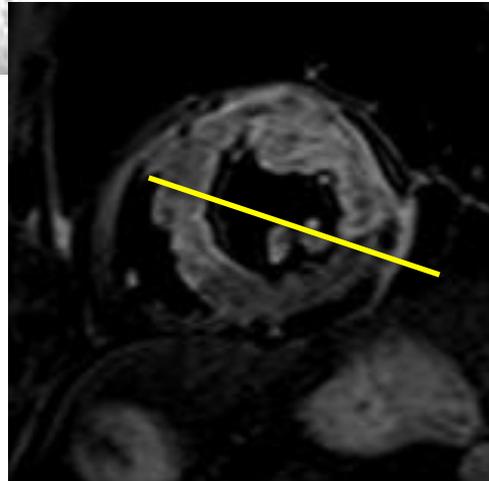

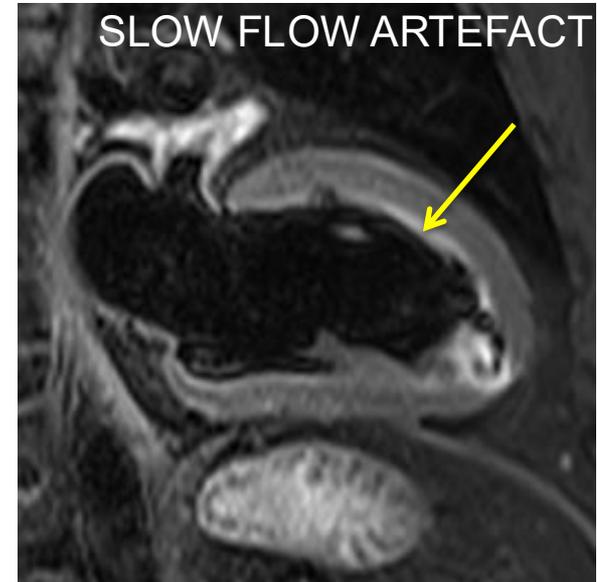

# T2-weighted Images

## PITFALLS

- Low SI artefacts
  - arrhythmia/through-plane motion → false low SI
- High SI artefacts
  - slow flowing blood, insufficient flow suppression

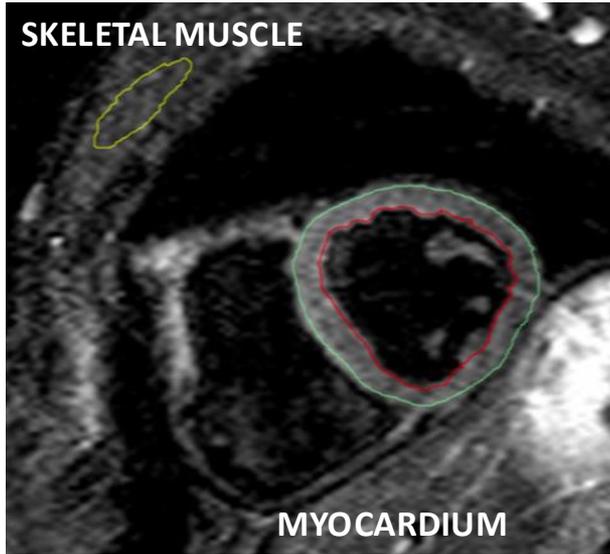

High SI  
Two orthogonal views

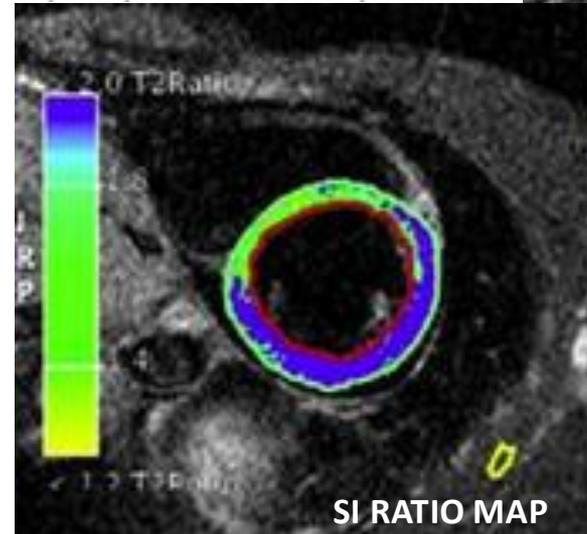

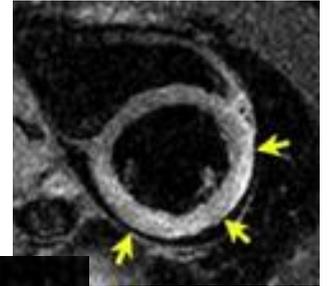

# T2-weighted Images

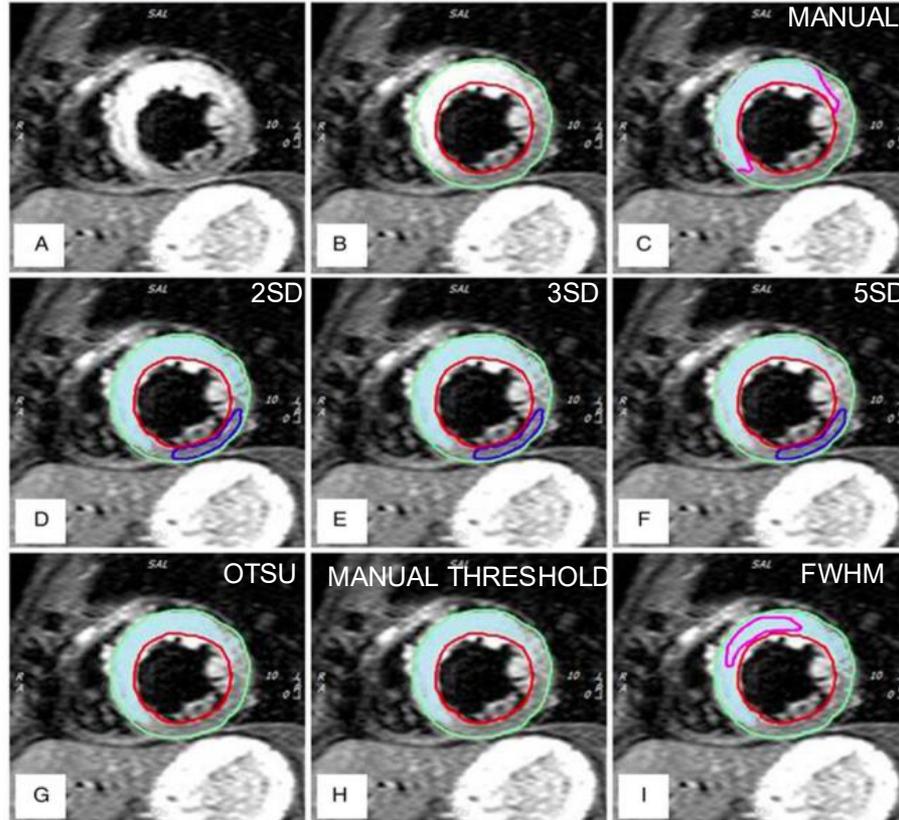

## SI Ratio Myocardium/Skeletal Muscle $\geq 2$

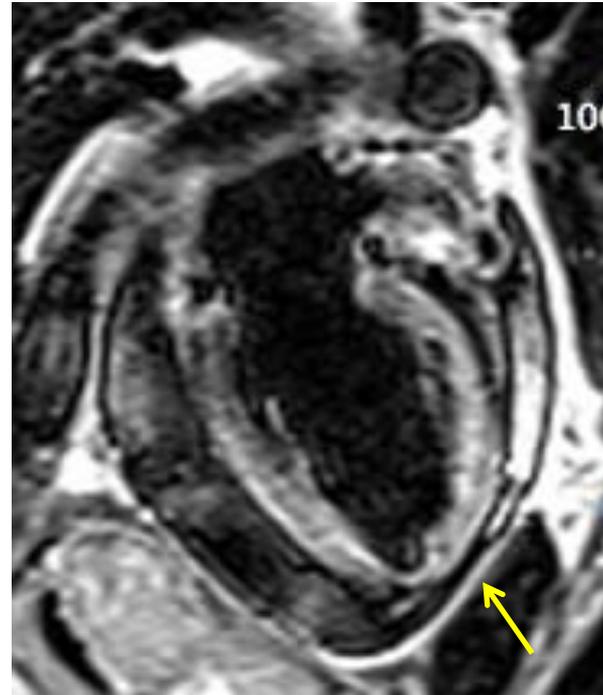

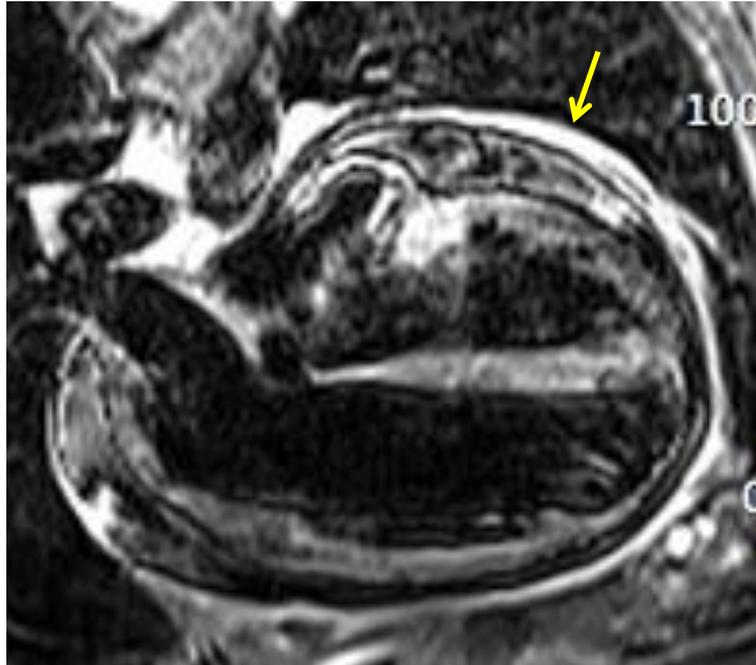

While a cut-off of 1.9 can be used for dark blood triple-inversion recovery spin echo [67], a locally established value is recommended, because SI and ratio values may vary between sequence settings (especially echo time (TE)) and CMR scanner models. For these images, a

# T2-weighted Images

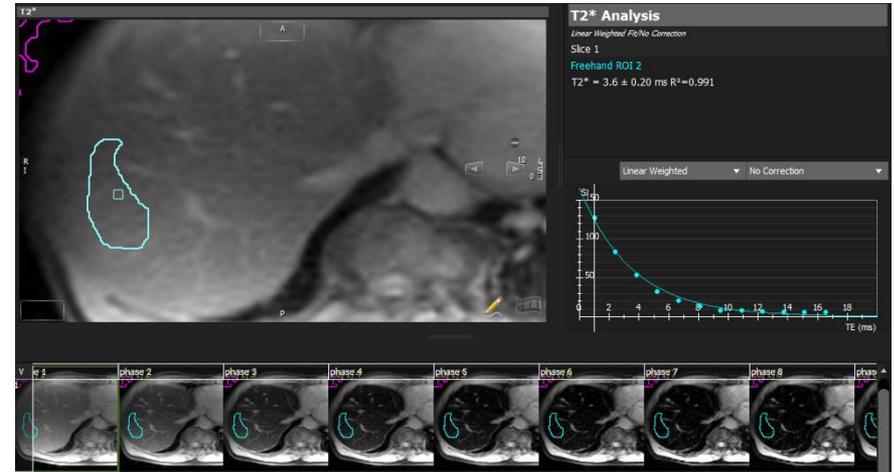

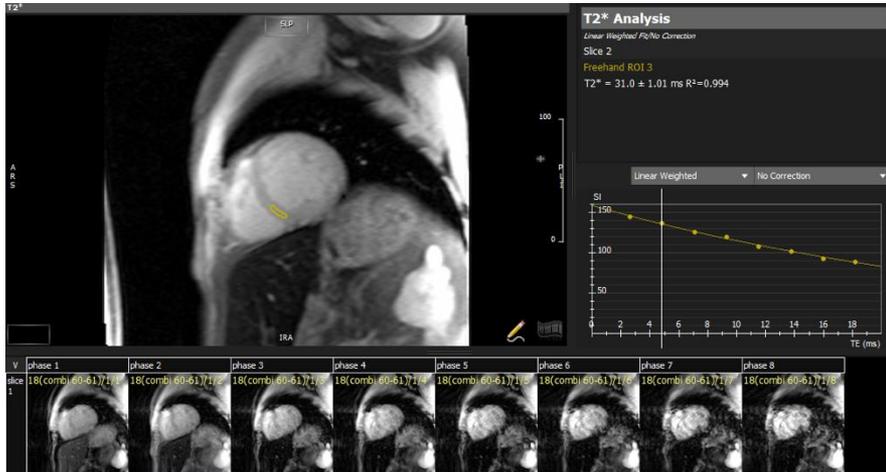

## PERICARDIAL OEDEMA

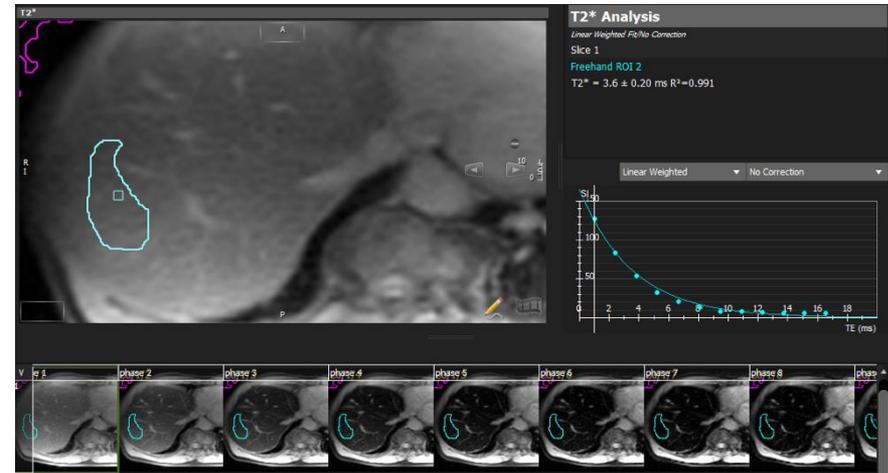

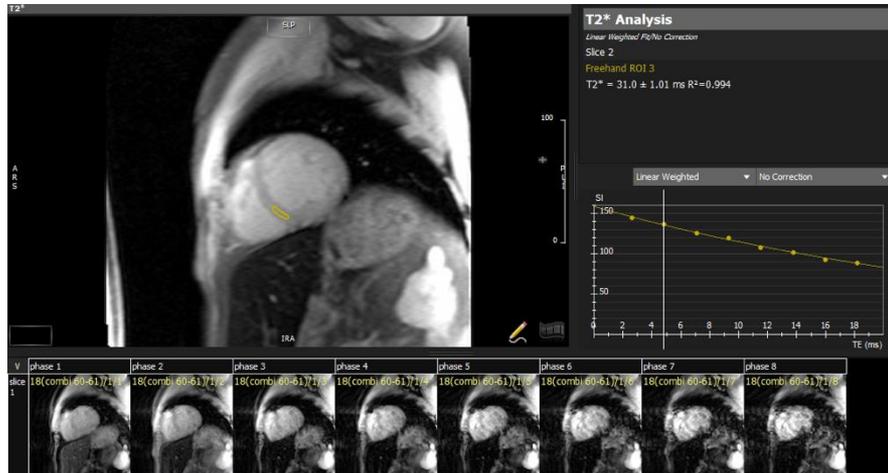

“Black blood” Gradient Echo (GRE), multi-echo  
Mid-ventricular slice → ROI on interventricular septum  
Transaxial slice on liver → avoid vessels when measuring

✓ Heart and liver iron overload

# T2\*-weighted Images

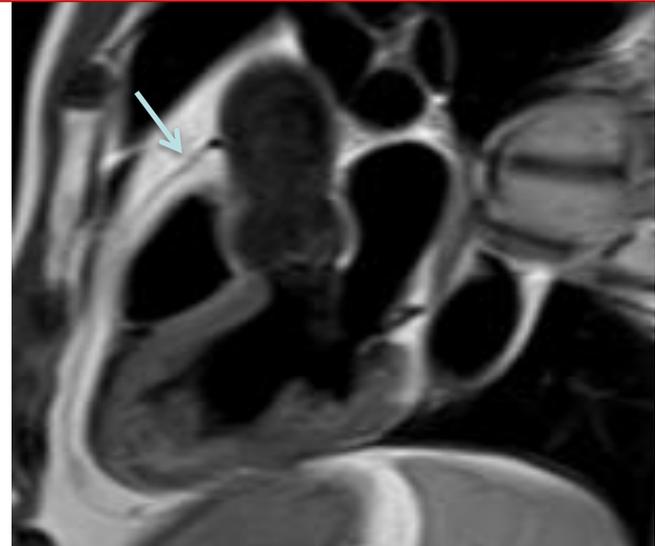

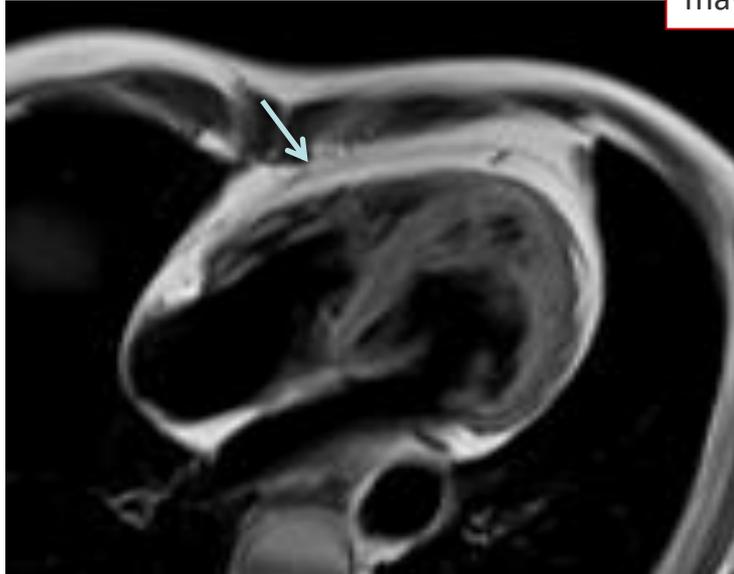

Myocardial T2*(ms)	Myocardial R2* (Hz)	Dry weight (MIC) (mg/g)	Hepatic T2* (ms)	Hepatic R2* (Hz)	Dry weight (LIC) (mg/g)	Classification
≥20	≤ 50	≤ 1.16	≥15.4	≤ 65	≤ 2	None
14-20	50 – 71	1.16 – 1.8	4.5-15.4	65 - 224	2-7	Mild
10-14	71 – 100	1.8 – 2.7	2.1 – 4.5	224 - 475	7-15	Moderate
≤10	≥ 100	≥ 2.7	≤2.1	≥ 475	≥ 15	Severe

## Turbo Spin Echo (TSE) with/without fat saturation

### ✓ Anatomy

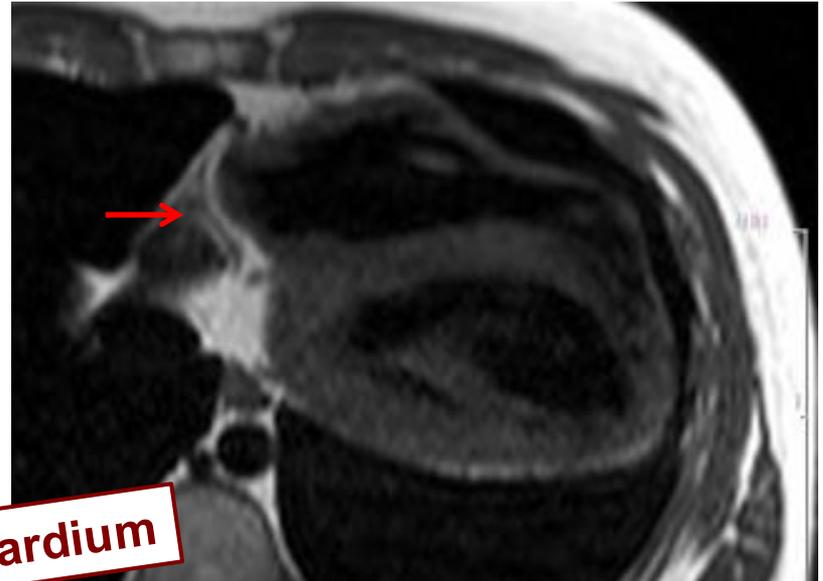

N.B. low signal of adjacent lung and paucity of surrounding fat, may hamper the pericardial visualization over the LV free wall

NORMAL PERICARDIUM

Turbo Spin Echo (TSE) with/without fat saturation

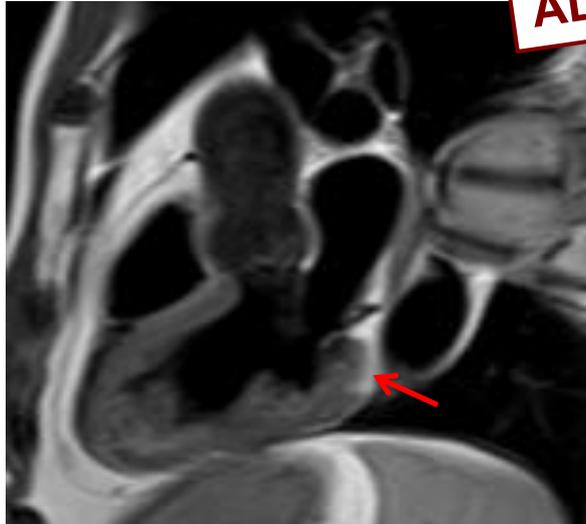

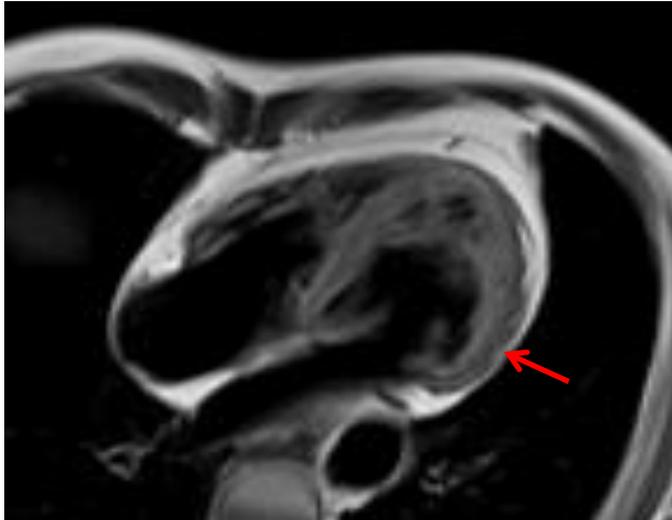

✓ Anatomy

**Absent pericardium**

Turbo Spin Echo (TSE) with/without fat saturation

- ✓ Anatomy
- ✓ Fat infiltration

ALVC

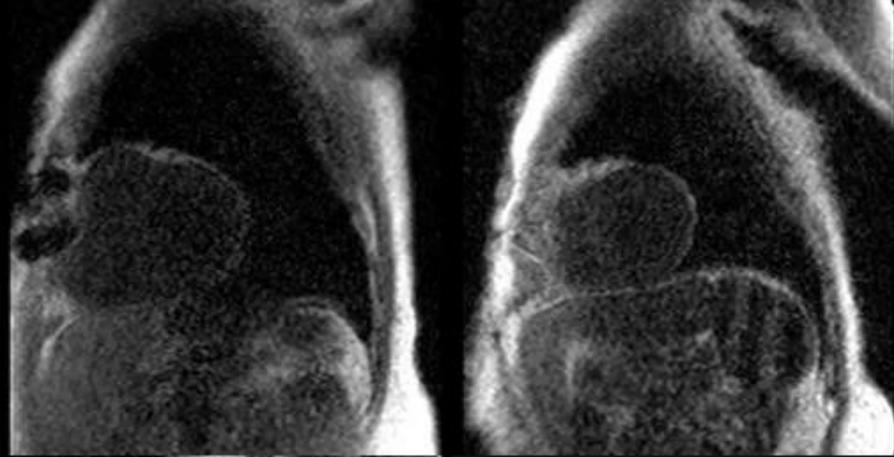

Saturation recovery GRE

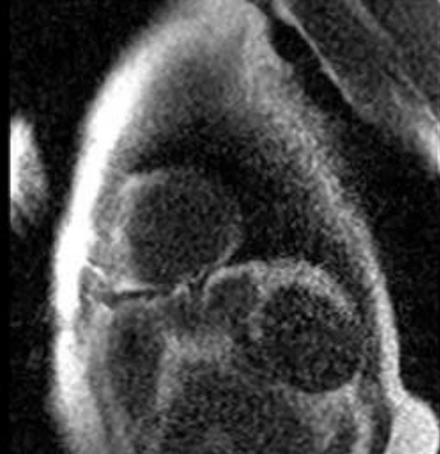

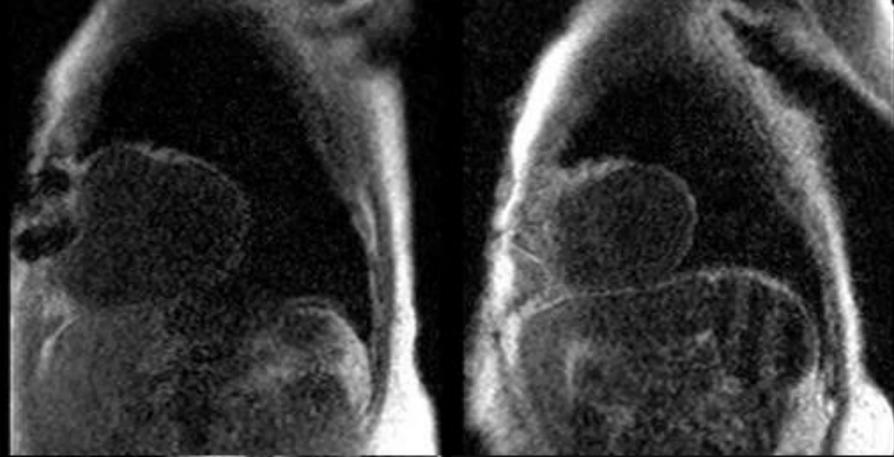

Three short-axis slices, >40 heart beats

Contrast (0.05-0.1 mmol/Kg) followed by 30 ml saline bolus

✓ At rest or following pharmacologic stress → myocardial perfusion defect

STRESS PERFUSION

STRESS PERFUSION

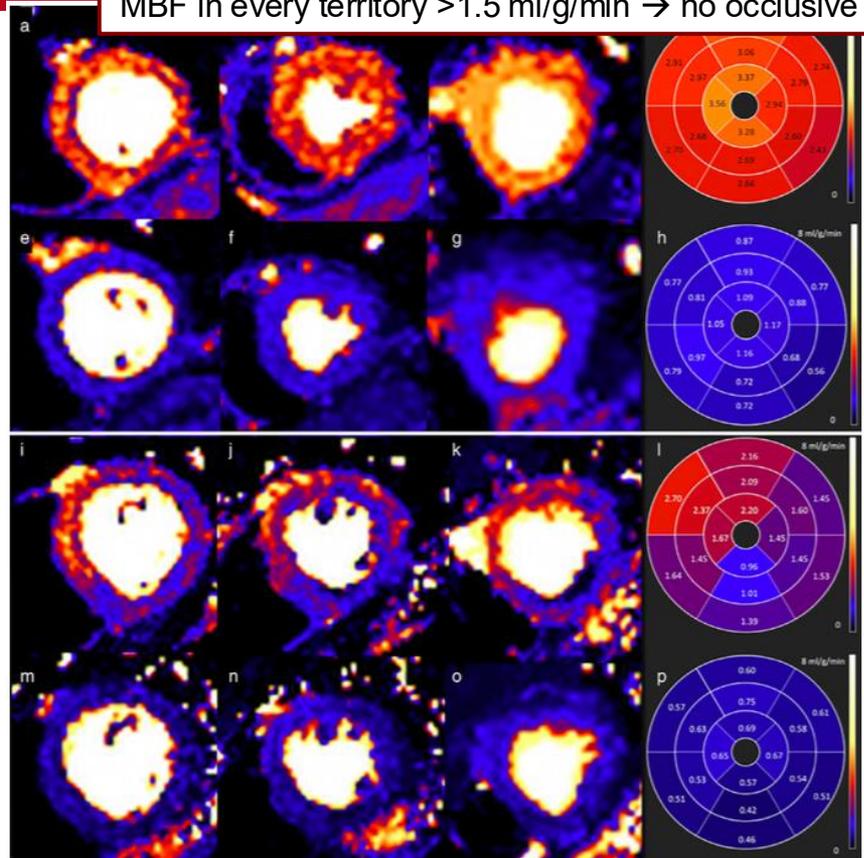

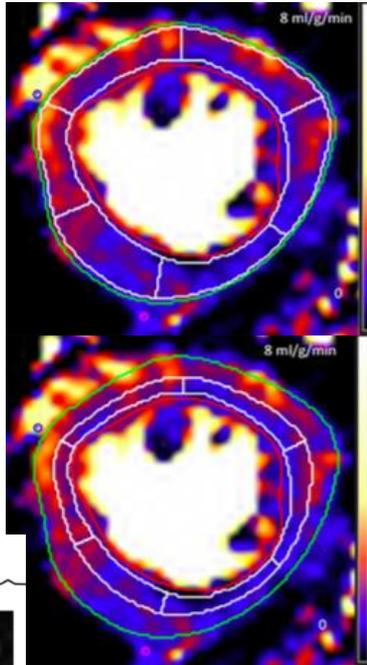

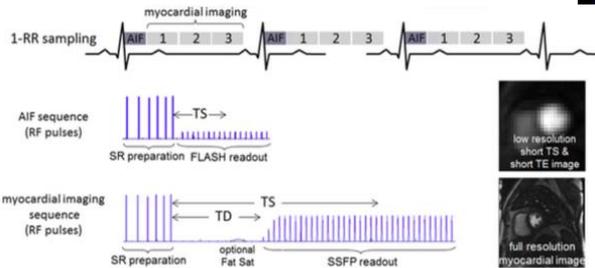

REST PERFUSION

MBF in every territory  $> 1.5$  ml/g/min  $\rightarrow$  no occlusive CAD

Quantification of myocardial blood flow requires knowledge of the amount of contrast agent in the myocardial tissue and the arterial input function (AIF) driving the delivery of this contrast agent

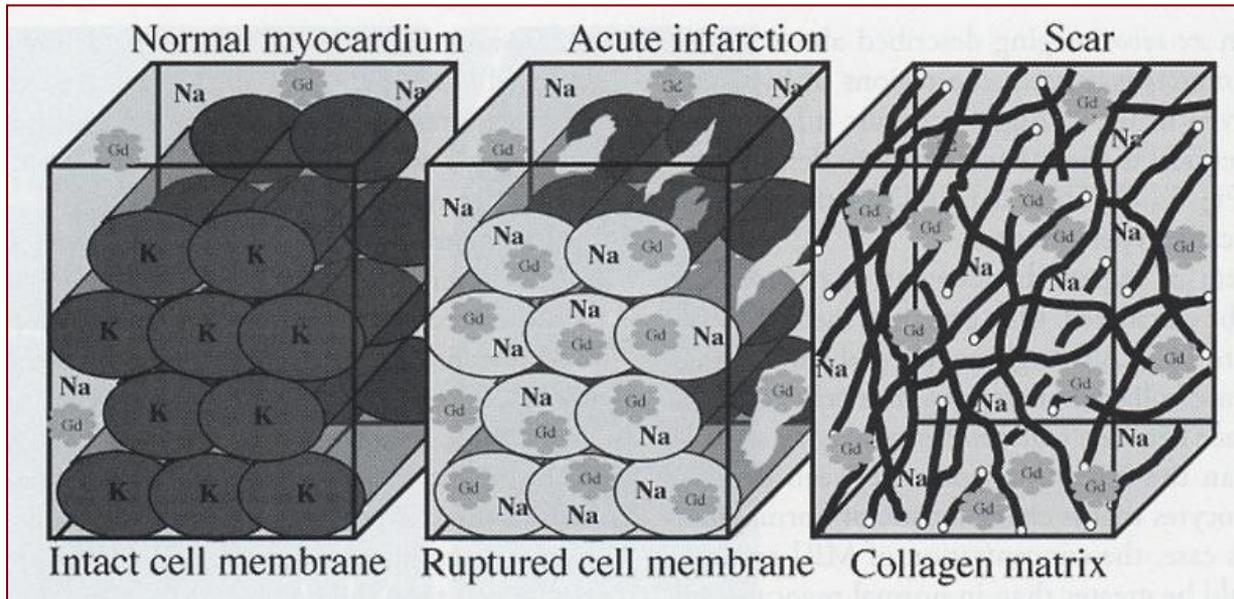

“DUAL”-SEQUENCE FOR MULTI-SLICE 2D SATURATION RECOVERY

# Gadolinium Contrast Agents

## Gadolinium

- Administered intravenously
- Extra-cellular distribution

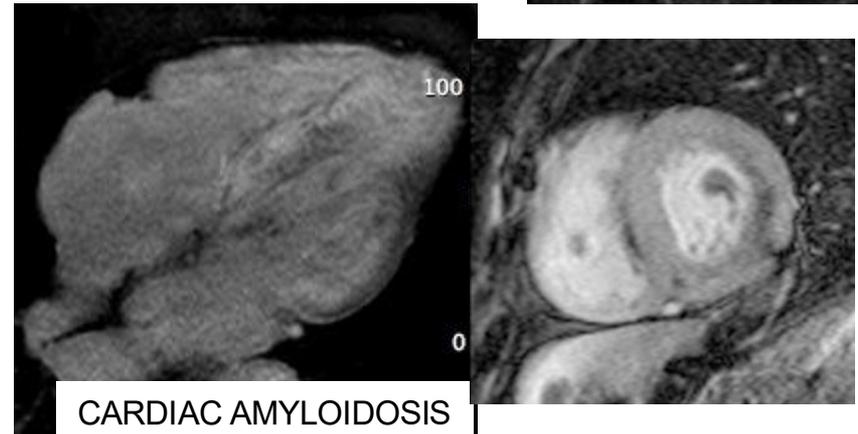

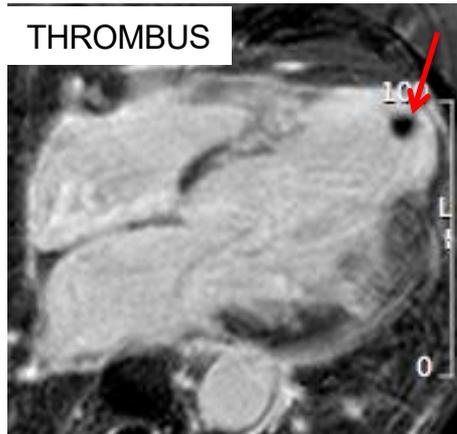

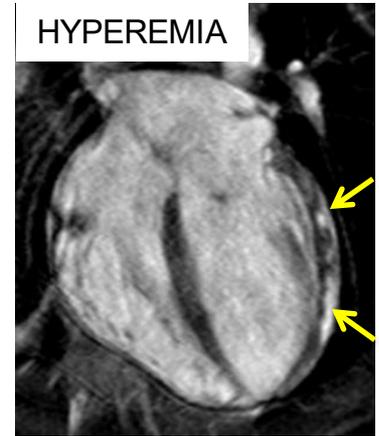

# Early Gadolinium Enhancement

Inversion recovery GRE

Acquired in mid-end diastole

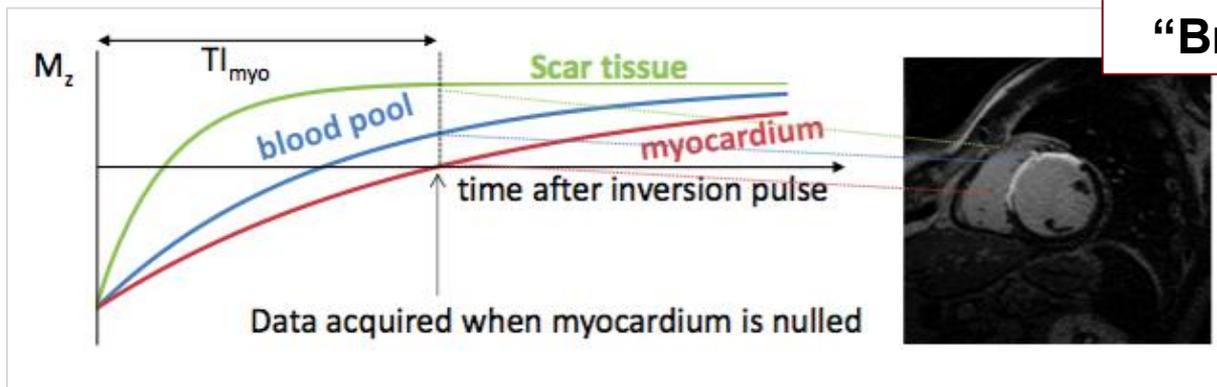

1-3 min after Gad administration → “Early Enhancement”

- ✓ Hyperemia
- ✓ Thrombus (TI >400 msec)
- ✓ Infiltrative disease (amyloidosis)

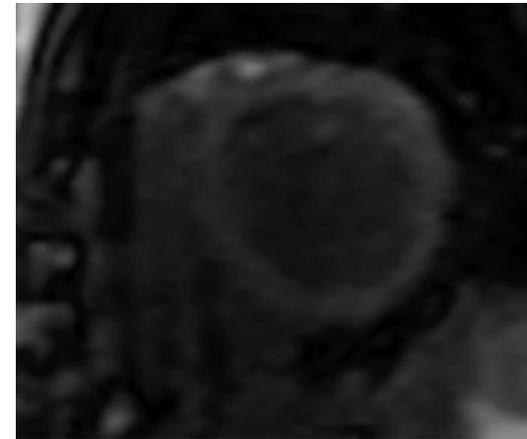

# Late Gadolinium Enhancement

**“Bright is bad”**

- 10-15 min after Gad administration → “Late Enhancement”
- TI Scout/Look Locker
- Increase TI by 10-15 ms every 2-3 min
- TI difficile da identificare → amiloidosi?
- Phase Swap – Cut through

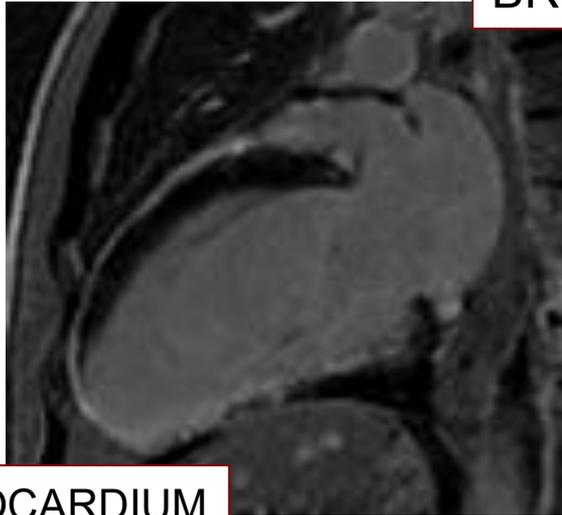

# Late Gadolinium Enhancement

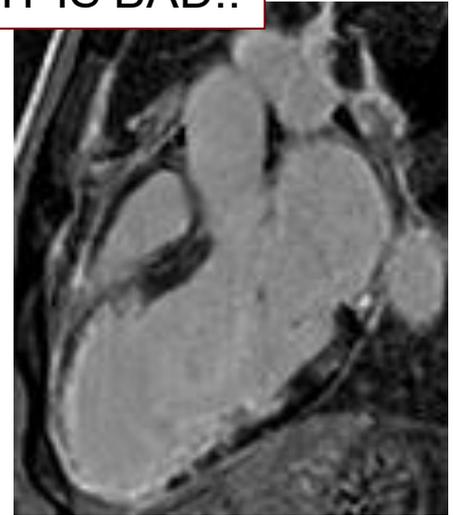

4C

NORMAL MYOCARDIUM  
IS BLACK

2C

3C

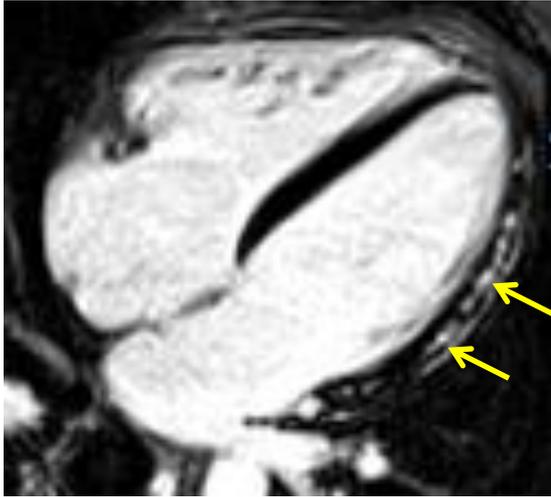

# Late Gadolinium Enhancement

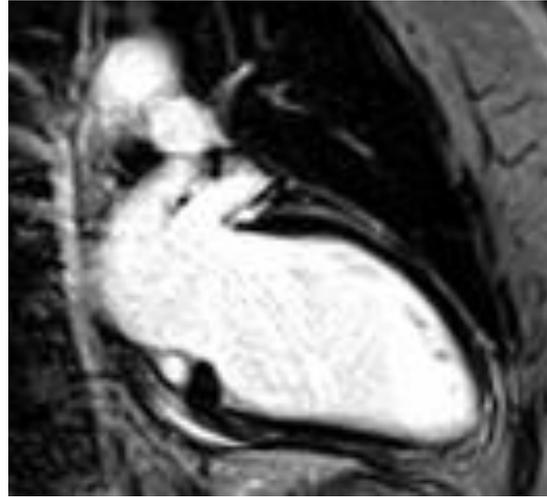

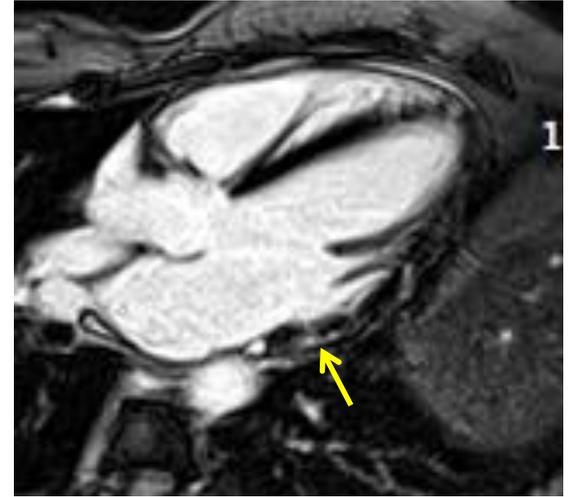

# Late Gadolinium Enhancement

# Late Gadolinium Enhancement

## PITFALLS

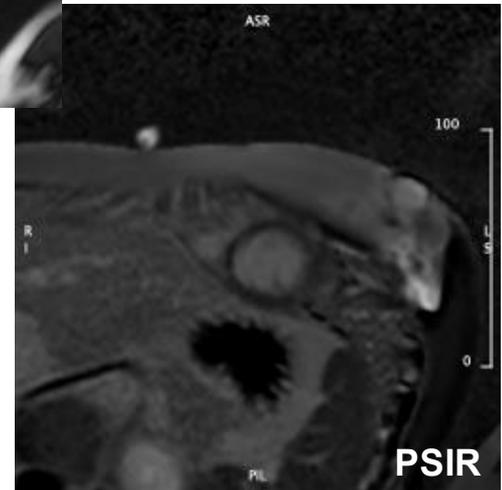

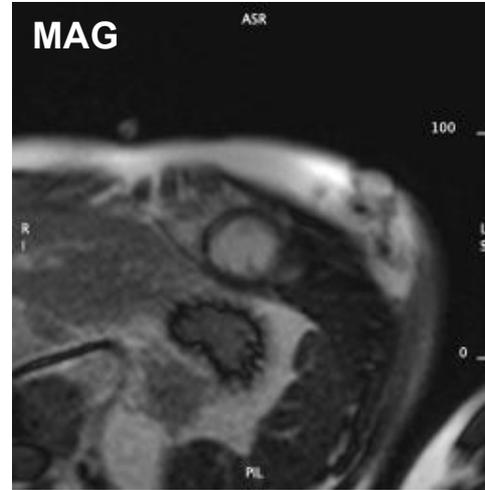

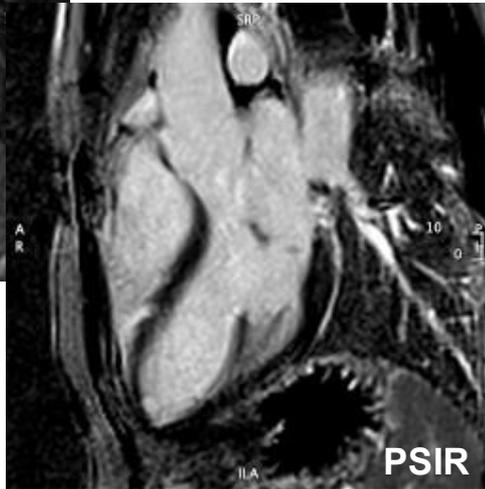

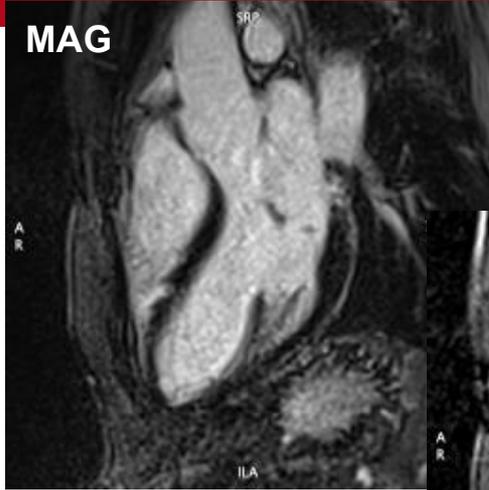

- Bright ghosting artefacts
  - poor ECG gating
  - poor breath-holding
  - long T1 species in the imaging plane (effusion)

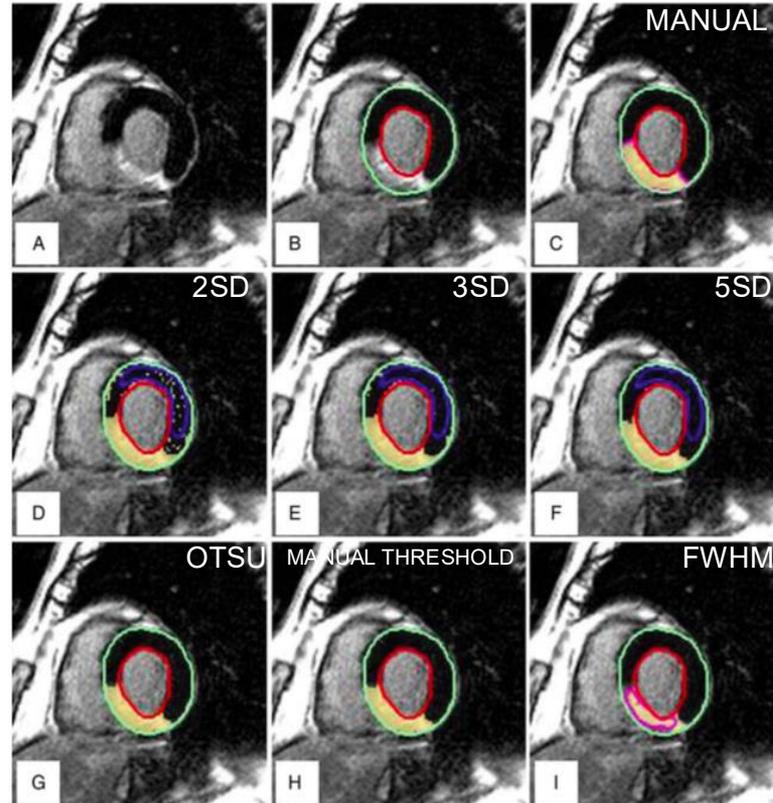

High SI  
Two orthogonal views

# Late Gadolinium Enhancement

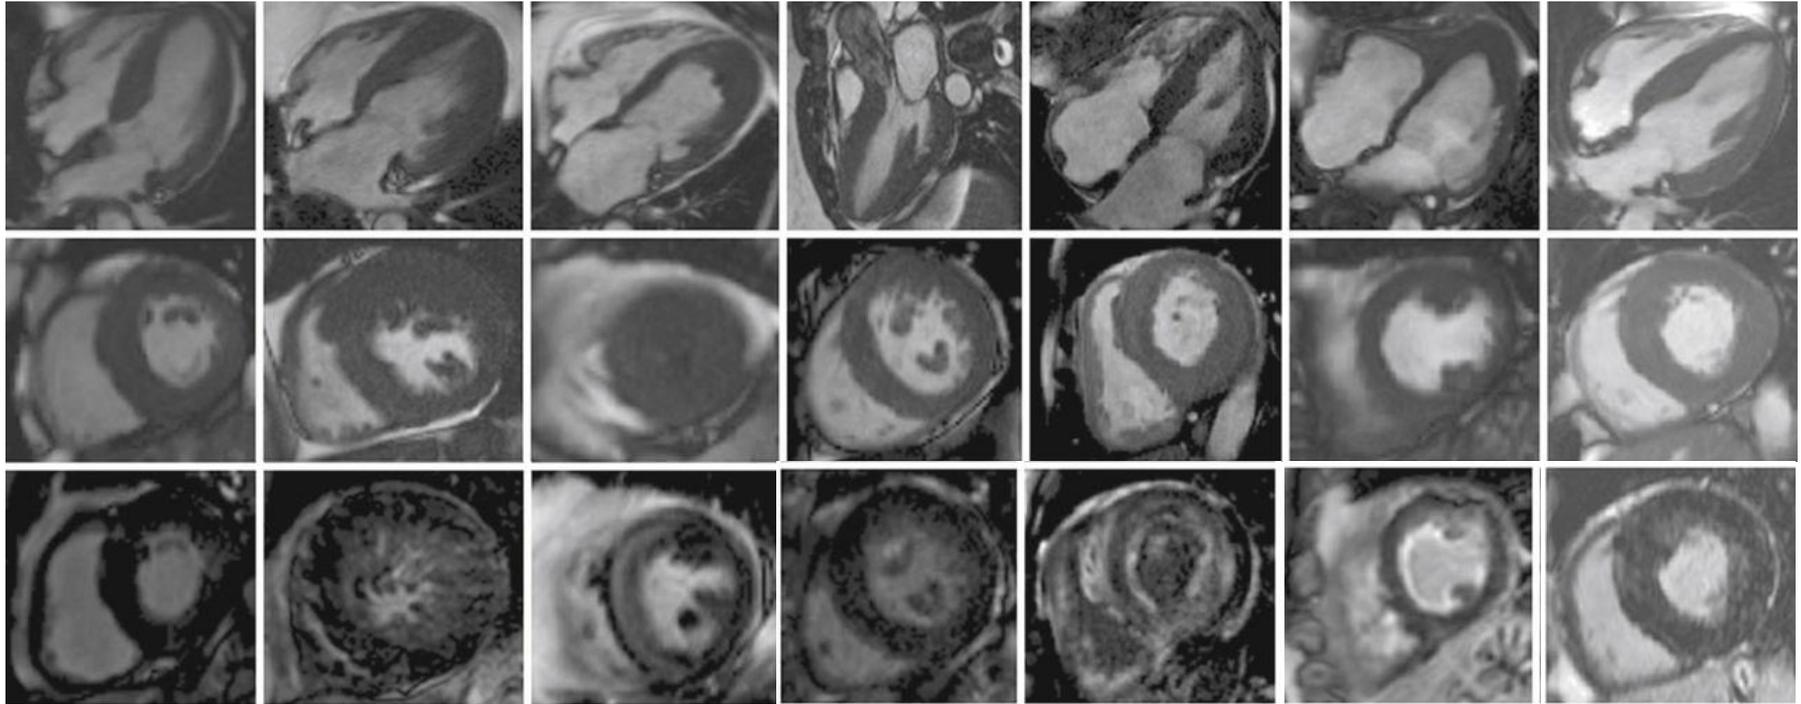

# Late Gadolinium Enhancement

# LGE – One size does not fit all

A HCM

B HCM

C Apical HCM

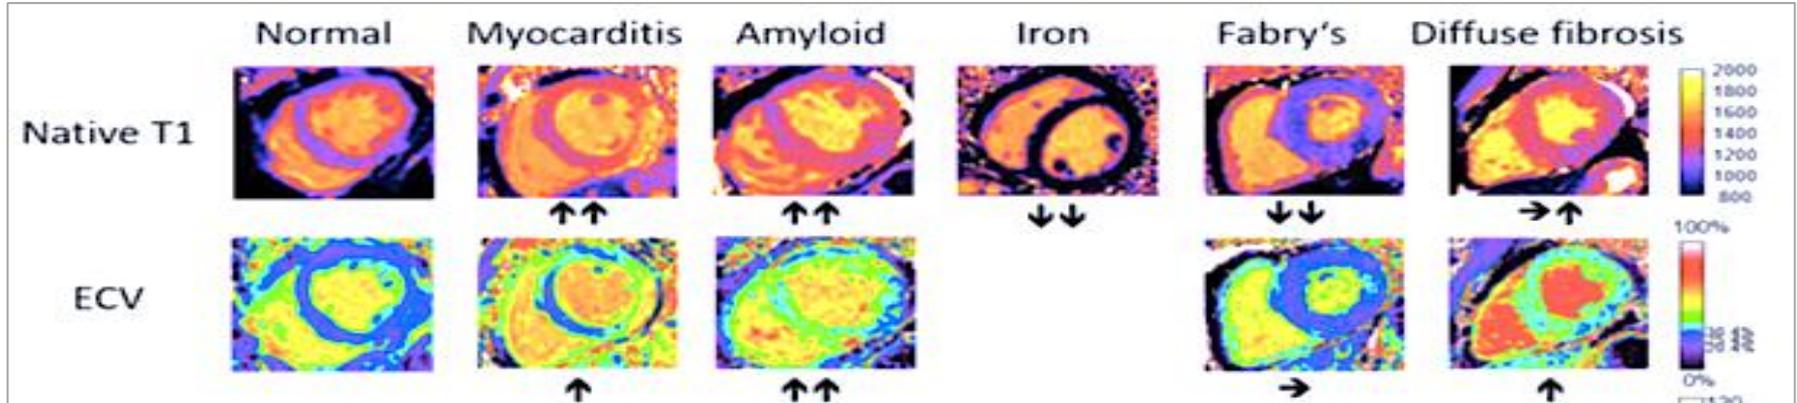

D Subaortic  
membrane

E Amyloid

F Endomyocardial  
fibrosis

G Hypertensive  
heart disease

# Parametric Mapping

## 1. T1 mapping

- a. Native T1 mapping is performed in the absence of contrast agents.
- b. Look Locker imaging (modified Look Locker Inversion recovery (MOLLI) or shortened MOLLI (ShMOLLI) or equivalent) should be used.
- c. Diastolic acquisition is best with the exception of atrial fibrillation in which systolic acquisition may be preferred. In patients with higher heart rates, specific sequences designed for these heart rates should be used.
- d. Source images should be checked for motion/artifact and imaging repeated if this occurs.
- e. Slice thickness: 6–8 mm, in-plane resolution ~ 1.6–2.0 mm
- f. The number and orientation of slices obtained will depend upon the indication. At least one short-axis map should always be obtained.
- g. For extracellular volume measurements, T1 mapping should be performed prior to contrast and at least 1 time point between 10 and 30 min post contrast bolus
- h. The hematocrit should be measured, ideally within 24 h of imaging, for the most accurate extracellular volume fraction (ECV) measurement.

## T2 mapping and T2-weighted (T2w) imaging

- a. Mapping - if quantitation is desired and sequence is available
  - i. Multiple alternatives exist, such as T2-prepared single-shot bSSFP sequence acquired with different T2 prep time, gradient and spin echo (GraSE) or FSE-based pulse sequences.
  - ii. Motion correction as needed
  - iii. Slice thickness: 6-8 mm, in plane-resolution ~ 1.6–2.0 mm
  - iv. The number and orientation of slices obtained will depend upon the indication. Short-axis maps should always be obtained.
- b. T2w Imaging
  - i. Black blood T2w short Tau inversion recovery (STIR)
    1. Potential pitfalls – bright signal in areas of low flow, signal dropout due to motion, and low signal in regions with intramyocardial hemorrhage.
  - ii. Bright blood T2w sequences
    1. T2-prepared single-shot bSSFP sequence
    2. FSE-bSSFP hybrid is an alternative
    3. Potential pitfall – bright signal may obscure endocardial border

## Description

1. **Scout imaging** as per LV function
2. Appropriate **vendor recommended** optimum T1-mapping sequence (e.g. MOLLI/ShMOLLI/SASHA etc.)
3. SA images - single mid-ventricular slice or 3 slices planned using “**3 of 5**” **technique**
4. **Gadolinium injection** (0.1 – 0.2mmol/kg)
5. Wait **at least 15 min** post contrast injection to acquire **post-contrast T1**
6. Take full blood count for haematocrit to calculate **extracellular volume (ECV)**
  
4. **FOV and voxel size should not be changed** between pre/post contrast T1 acquisition to allow generation of ECV maps

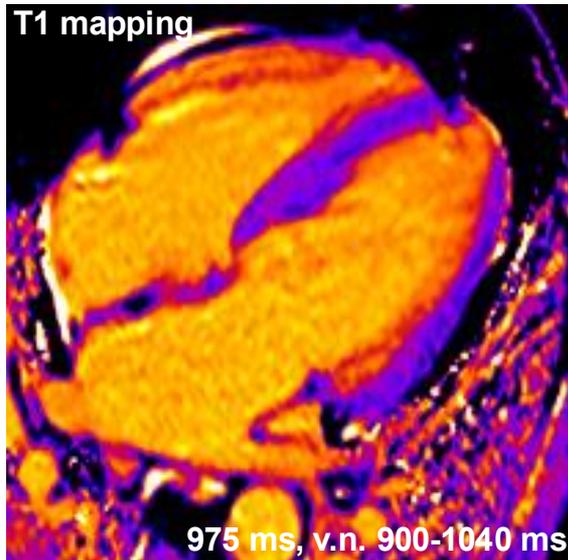

## Tips & Tricks

1. Acquire **one slice per breath hold**
2. Native T1 values are reproducible but **they vary by magnet strength** (with 3T resulting in longer native T1 times), **vendor platforms and the mapping sequence**
3. Check scanner generated native T1 map for **breathing artefact**. Consider changing voxel size, fold-over or adding SENSE to reduce breath-hold
4. **FOV and voxel size should not be changed** between pre/post contrast T1 acquisition to allow generation of ECV maps

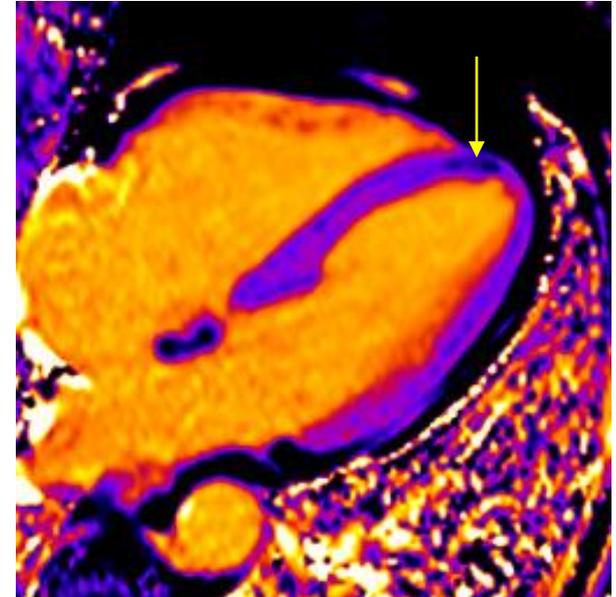

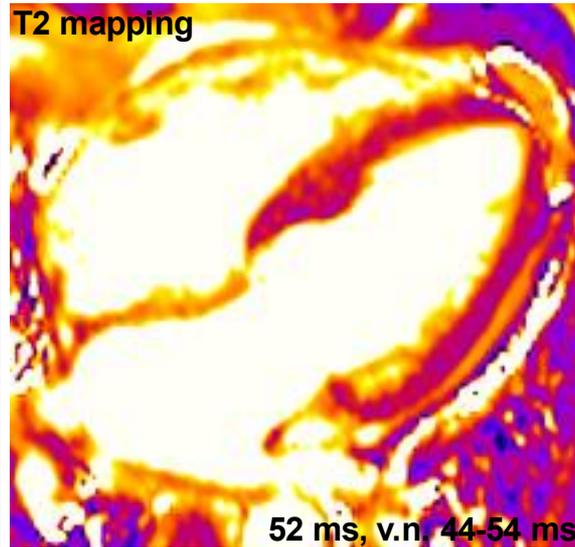

Native $T_1 \uparrow$	Native $T_1 \downarrow$
<ul style="list-style-type: none"><li>• <i>Oedema</i> e.g. tissue water <math>\uparrow</math> in AMI, inflammation, pericardial effusion</li><li>• <i>Increase of interstitial space</i> (replacement) fibrosis, scar, cardiomyopathy, amyloid deposition</li></ul>	<ul style="list-style-type: none"><li>• <i>Fat/Lipid overload</i> e.g. lipomatous metaplasia in chronic MI, Anderson-Fabry, lipoma</li><li>• <i>Iron overload</i></li></ul>
